

The State of Fedora

(F21, F22, and beyond)

Presented by
Matthew Miller
Fedora Project Leader

very Fedora

Wow

much sysadmin

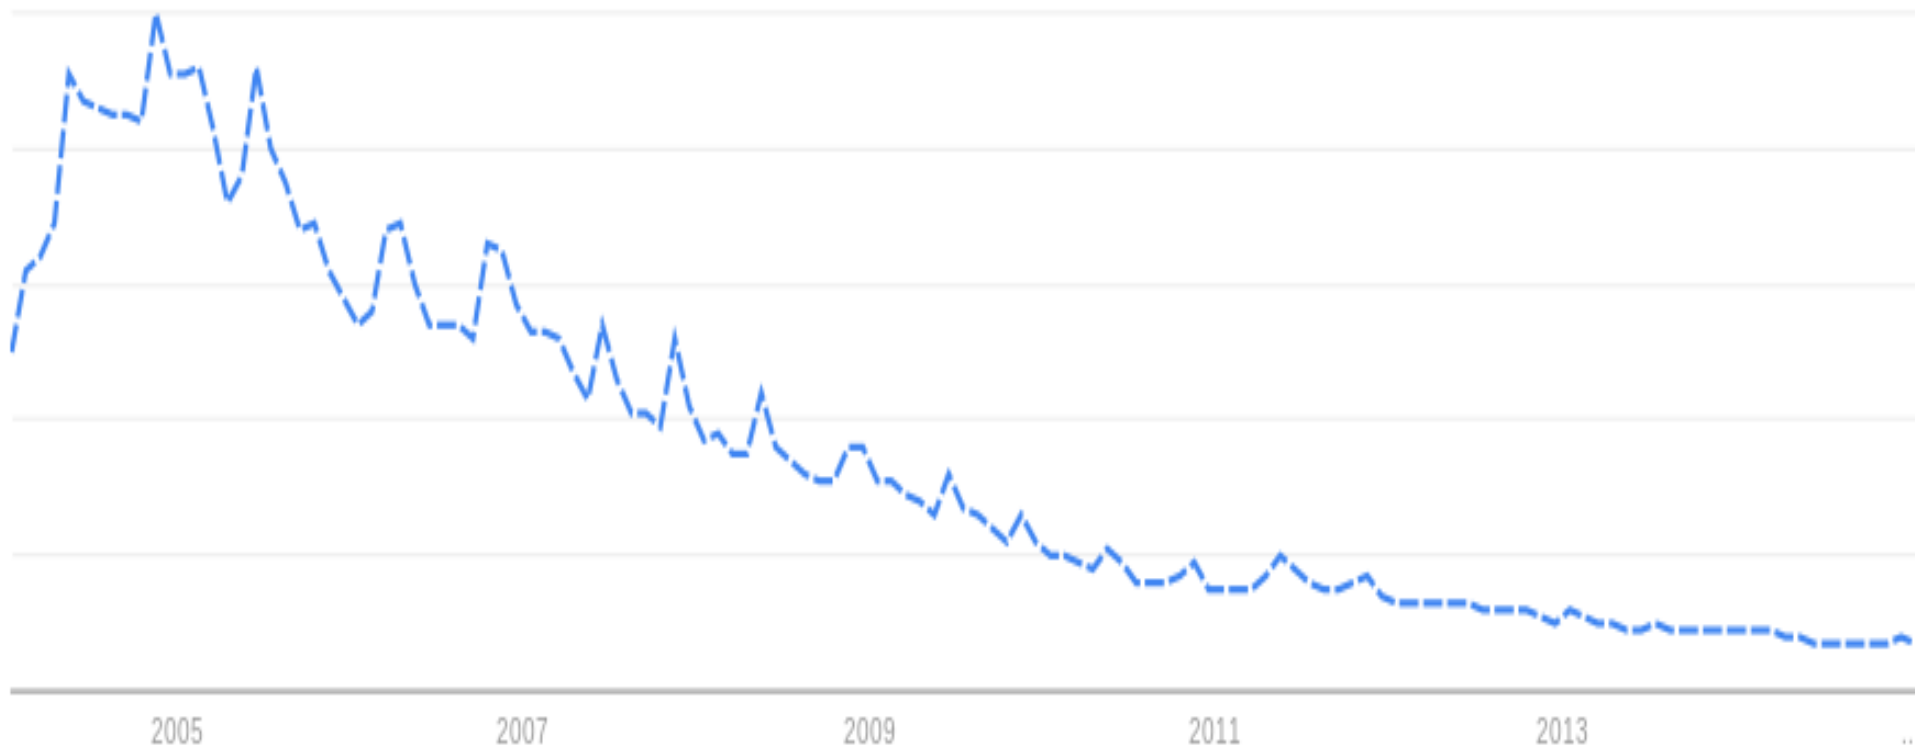

lol mattdm

so hpc

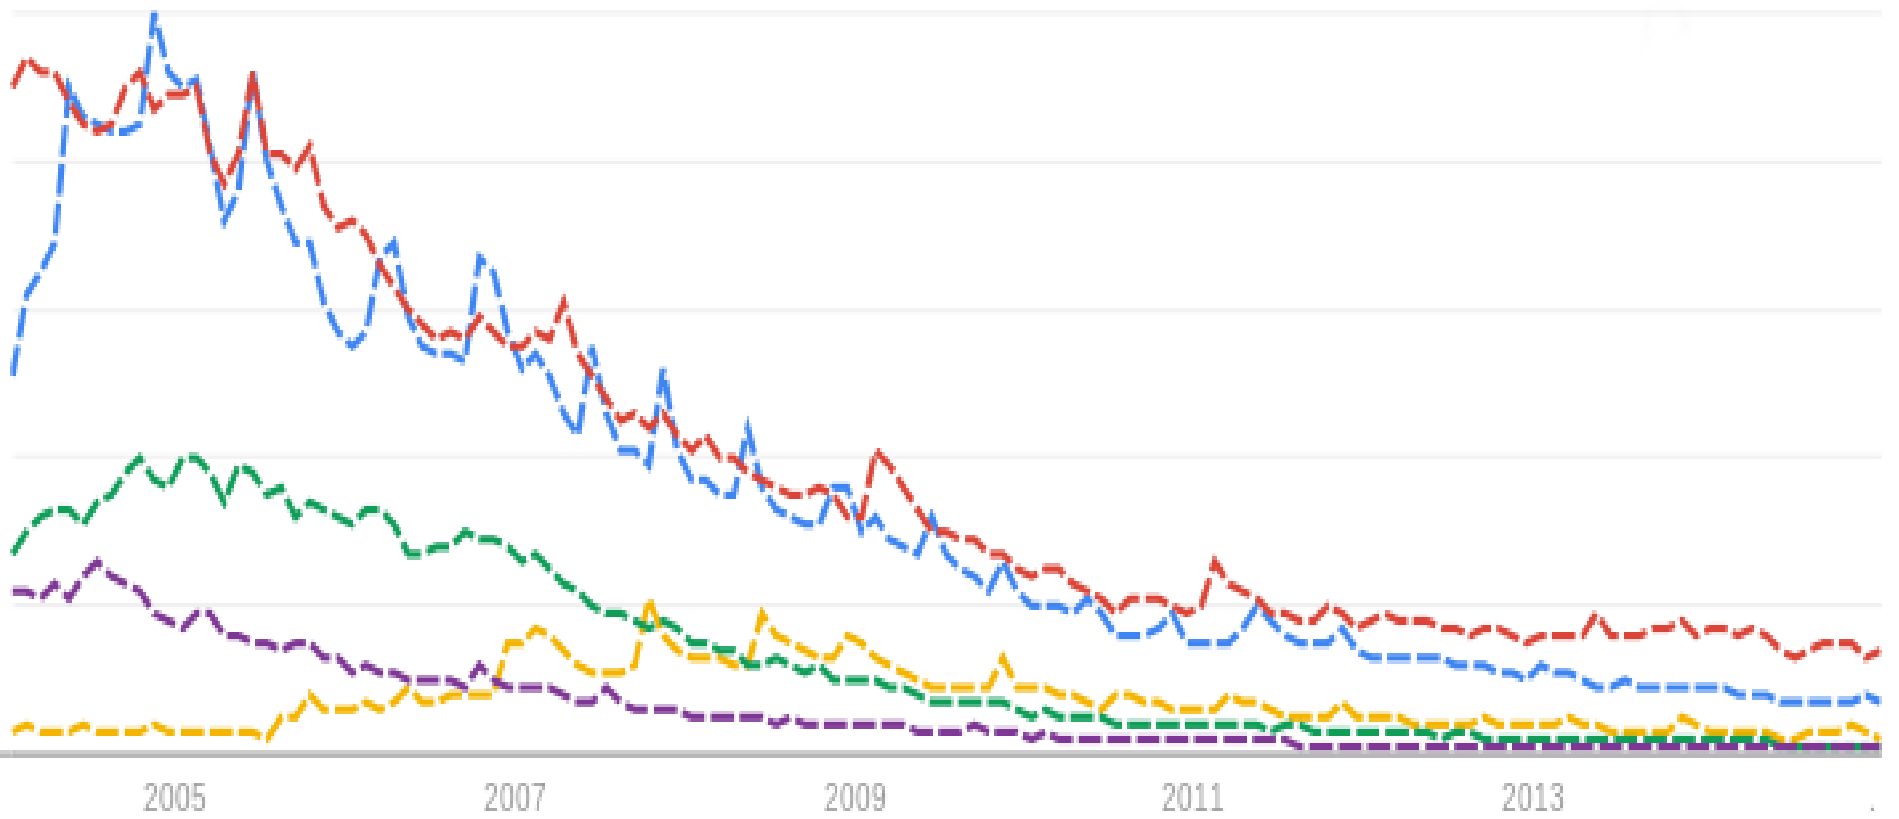

such university

many red hat

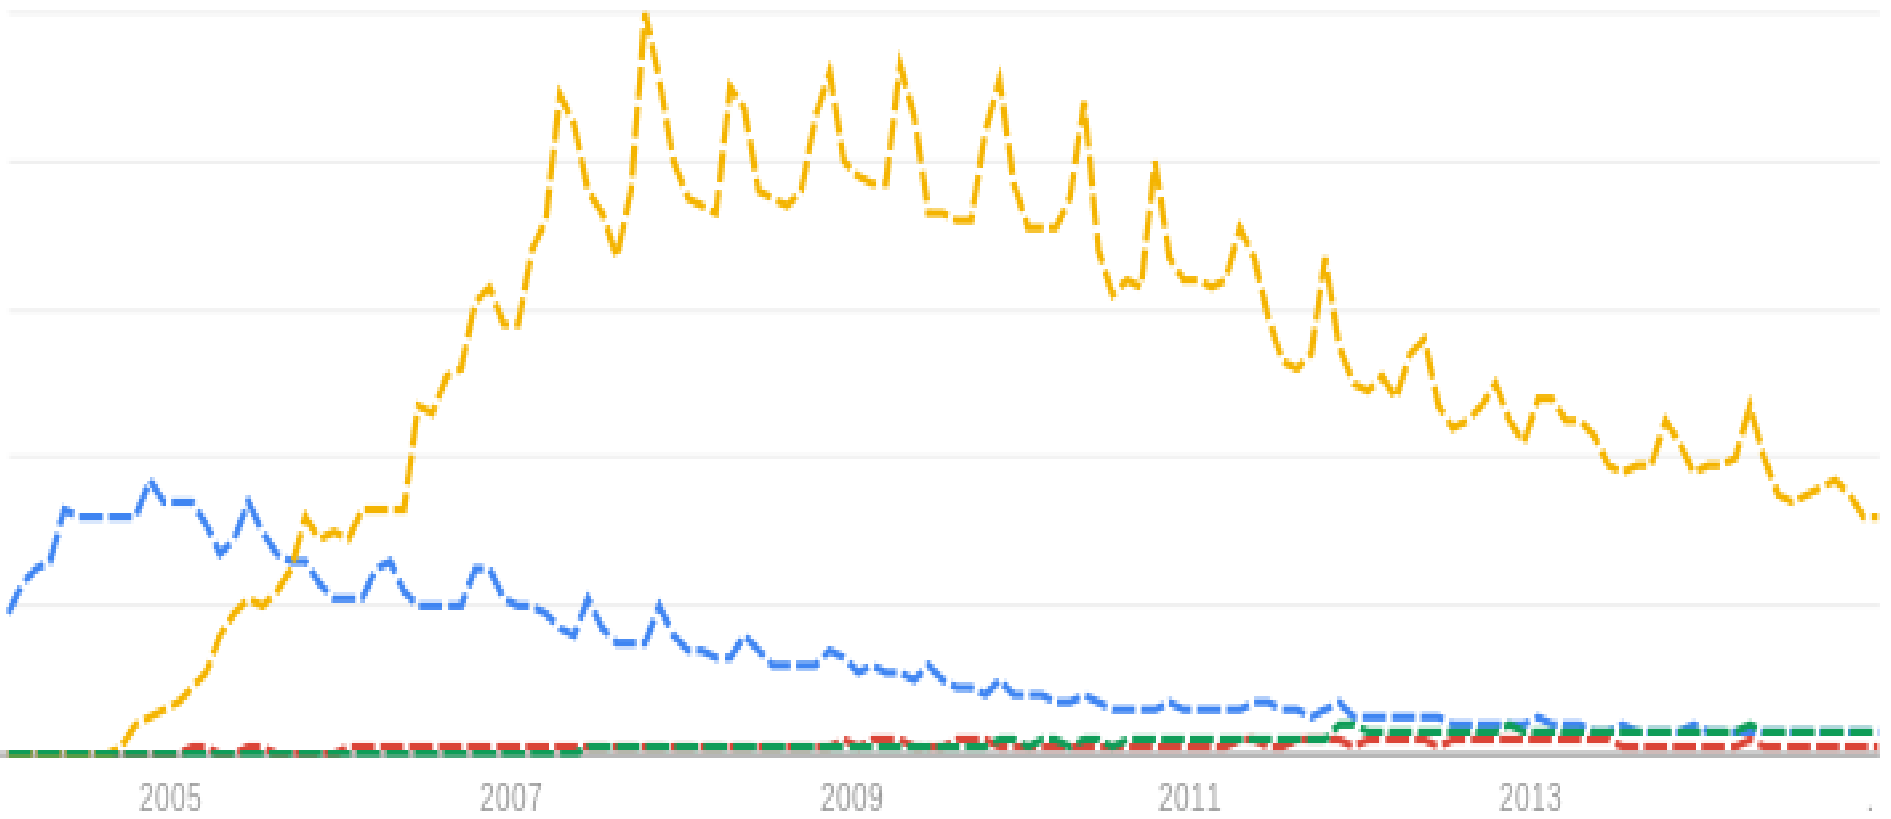

Fedora Debian SUSE Gentoo Slackware

Fedora Arch Linux Ubuntu Linux Mint

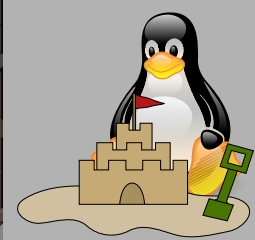

(This is not what I'm talking about.)

Fedora GitHub

Fedora

GitHub

Meanwhile, in the world

- Phones! Tablets! Android! ChromeOS!
- IT budgets shrinking, automation everywhere
- Cloud! EC2! OpenStack! GCE! (And, PaaS)
- Containers! Docker! CoreOS!
- Language-stack package centers

And so...

- Base OS considered boring
- Distro effort / reward balance changed
- Distro-level package management obsolete?

Shout outs!

- Everyone is awesome.
- openSUSE
 - Community release engineering
 - Rings model for Factory
 - Continuous integration
- Arch Linux documentation rules
- CoreOS

Fedora.next

- A word for planning and direction-setting — instead of marching ahead without looking around
- No secret agenda (except Fedora success, which isn't too secret)
- Open to your contributions
- Going to take a few years, with incremental improvement

Additive, not Restrictive

- We do a pretty good job of making the base distro
- Collection of packages is mostly high quality

So:

- What do we need to do outside of that?
- How can we make what we already have even better?

More... things!

- Positive voice for server and cloud
- RHEL and CentOS stakeholders
- Strategy for desktop success
- Combat or work with “base = boring” trend
- Difficulty building on top of Fedora
- Barriers to entry in the wrong place
- Balance of innovation vs. change management

CLOUD

SERVER

WORKSTATION

Why?

- Voice for Server
- User focus for Workstation
- Flexibility for Cloud

More why!

- Grow the user base in strategic areas
- Easier development target
- Connect server to future RHEL

We can ship sets
without taking away
the basic blocks!

Docker! Docker! Docker! (Kubernetes!)

Project Atomic: best, most secure way way to run containerized apps in the cloud

Cloud Base Image: minimal base

fedora^f
SERVER

Easy deployment of predefined server roles
Using an API or the Cockpit GUI

fedora^f
WORKSTATION

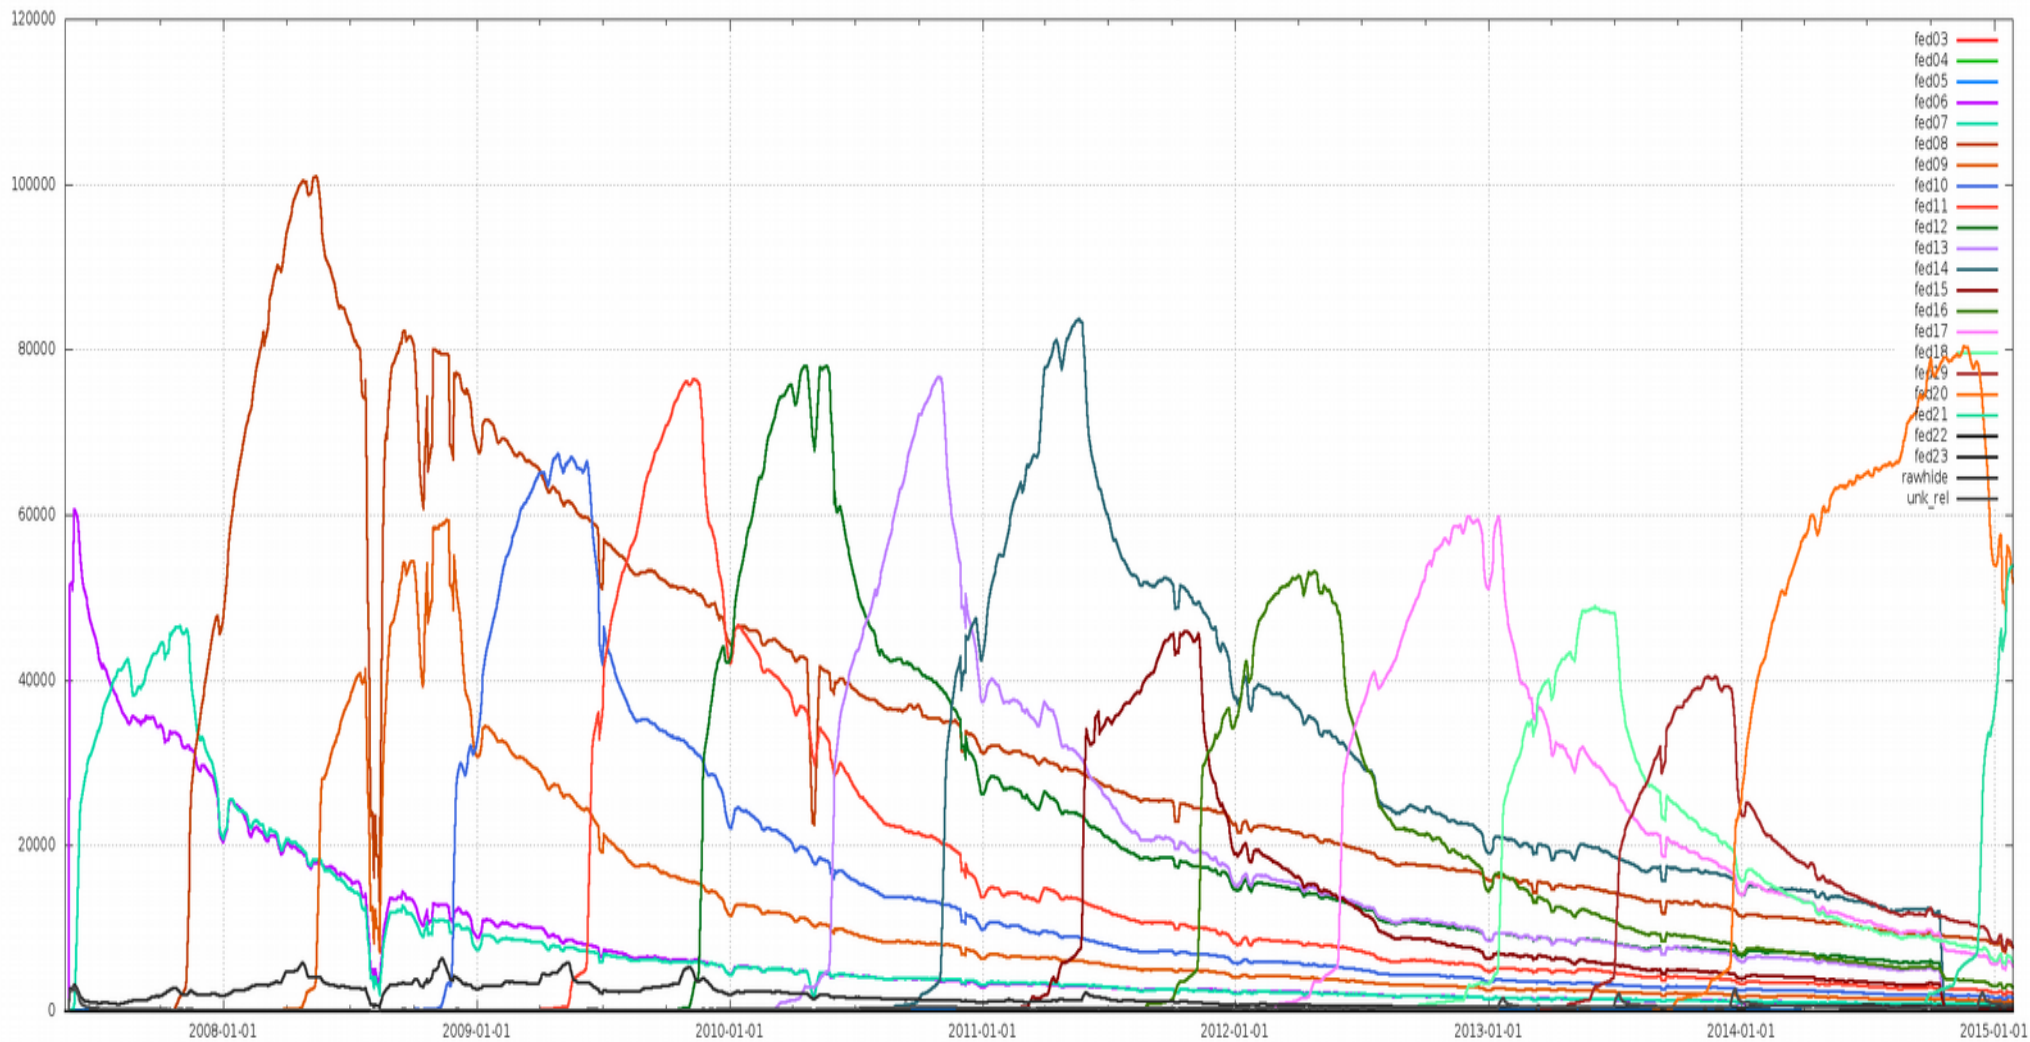

Best Linux desktop for developers
(developers are people, too)

- Workstation
- Server
- Cloud
- Other

Extremely rough numbers with considerable guesswork and not yet enough data

Fedora OS Yum Unique IPs (7 days moving average)

Ring 3 - Apps

Ring 1

Base Design

Ring 2

- Environments & Stacks

& Stacks

Ring 0
JeOS

Base Design

- A self-hosting “center”
- Self-hosting is hard but important
- Common core for everything else
- An API we can (eventually) define
- Focus engineering resources for quality

Env & Stacks

- Environments are where you run the code *you* care about
 - PaaS
 - Desktop app containers
- Stacks are modular collections of *software which is used by other software*
 - Languages
 - Frameworks
 - Databases
 - Whatever

Apps?

- This is a future thing. We'll see where it goes!
- Atomic
- LinuxApps?

Ring Rules

- Policy model, not an OS layer diagram
- Bundled libraries (with documentation?)
- Multiple versions
- Not necessarily RPM everywhere!
- Different lifecycles (not yet!)
- SIGs create “bubbles” of policy
- Traditional RPM packaging has a place too

Fedora 22

- May Release (Strict schedule. Well, *strictish*.)
- Python 3 by default
- DNF package manager
- Gnome 3.16
- More Server Roles
- Even more minimal cloud image
- Updated Atomic
- Other stuff: Elasticsearch, local DNS, libinput, Ruby 2.2 + Rails 4.2, Perl 5.20, GCC5
