

Do Software Collections still matter?

With containers, unikernels, and all the new hotness?

Presented at FOSDEM 2016 by

Langdon White

Platform Architect
Red Hat, Inc

Who am I?

Langdon White

- Formerly Evangelist for RHEL
- Platform Architect for Developer Experience
- Working on Fedora Modularity

Thomas

- Plays a lot of soccer/football and basketball
- Lots of homework
- Uses Instagram to talk to friends

Yes!

You can go now, if
you like

OK, if you stayed

Containers

- Monolithic applications
- Avoid conflicts with base container content
- Simple packaging
- Simple combinations

Unikernels (Uni-kernels?)

- Only conceptually applicable
- A wrapper for building a unikernel from packages (like a Dockerfile)
- At runtime, can still provide multiple versions

New hotness

- Provides logical separation of similar components
- Migration from the old thing to the new thing
