

# How I Turned a **Raspberry Pi** into an Open-Source Edge Cloud

**Pablo del Arco**

Cloud-Edge Innovation Engineer @ OpenNebula Systems

OpenNebula.io

# Hello, FOSDEM!

Pablo del Arco | **Cloud-Edge Innovation Engineer** at OpenNebula Systems

**Pablo del Arco**

**Cloud-Edge Innovation Engineer**  
@ OpenNebula Systems

## → My Journey

- ◆ **Spain** 🇪🇸: Born in Murcia, now based in **Valencia** ☀️
- ◆ **France** 🇫🇷: MSc @ **EURECOM**, Sophia Antipolis 🌂
- ◆ **Finland** 🇫🇮: MSc @ **Aalto University**, Helsinki ❄️

## → Main Focus

- ◆ Cloud computing
- ◆ Internet of Things
- ◆ **Homelab** (K8s cluster 🦉)
- ◆ I write **tech blog posts** in **Medium!**

*Follow me!*

## → Current focus

- ◆ I develop **new features** and **applications** for OpenNebula as part of the **Innovation** Unit.

# Table of Contents

# What is OpenNebula?

# OpenNebula: Open-Source Cloud Platform

The **open source platform** for the cloud-edge continuum

**OpenNebula** is an **open-source** cloud management platform that unifies **VMs, containers, and Kubernetes** under a **single pane of glass**. From data centers to edge nodes, it orchestrates workloads across the entire cloud-edge continuum.

**Multi-Hypervisor**  
KVM & LXC containers

**Hybrid & Multi-Cloud**  
Integration with AWS, **Scaleway**,  
**OVH cloud**, and more!

**ARM64 Native**  
Full support since v7.0

**Kubernetes Ready**  
Cluster API, OneKE,  
**RKE2**

**AI-ready platform**  
OneDRS + **MCP** integration

**Enterprise Features**  
Multi-tenancy,  
**federation**, HA

# Why OpenNebula for Edge Computing?

Feature / Platform	OpenNebula 7.0	Proxmox	VMware / CloudStack
ARM Support	✓ Yes (Native)	✗ Unofficial / Experimental	✗ No (x86 only)
Marketplace ARM Images	✓ Yes (Native)	✗ No official ARM templates	✗ No
Installation Simplicity	✓ Simple (MiniONE/OneDeploy)	Complex / Unsupported	✗ Unsupported on ARM
Resource Efficiency	✓ Very High	High (x86 only)	Low (x86 only)
Edge / IoT Use Cases	✓ Native Support	Limited	✗ Not designed for Edge

OpenNebula leads in ARM and edge deployments — the clear choice for edge computing and IoT.

# Why OpenNebula for Edge Computing?

Feature / Platform	OpenNebula 7.0	Proxmox
ARM Support	✓ Yes (Native)	✗ Unofficial / Experimental
Marketplace ARM Images	✓ Yes (Native)	✗ No official ARM templates
Installation Simplicity	✓ Simple (MiniONE/OneDeploy)	✗ Complex / Unsupported
Resource Efficiency	✓ Very High	✗ High (x86 only)
Edge / IoT Use Cases	✓ Native Support	✗ Limited

OpenNebula leads in ARM and edge deployments – the clear choice for edge computing and IoT.

# ARM64 vs x86 Architecture Shift

Market Transition and Future Outlook in Edge Computing

2024 BASE

18% ARM64

Initial penetration in edge deployments.

2025 SURGE

+70% YoY

Growth in ARMv9 server shipments.

2030 TARGET

65% Share

Projected dominant edge architecture.

Edge Deployment Architecture Share (%)

ARM64 x86 Legacy

# The **Challenge** of Traditional Clouds

## Traditional Clouds

- **Far from data** is generated
- Latency-sensitive apps **suffer**
- **Bandwidth costs** for data transfer

## Edge Computing Needs

- **Process data locally**
- Sub-millisecond response times
- **Work offline** or with limited connectivity

## The Gap

- Enterprise platforms **too heavy**
- DIY solutions **lack features**
- **ARM support** historically **poor**

What if you could run an **enterprise-grade cloud on a \$50 device?**  
With **OpenNebula 7.0** and native **ARM64** support, now you can.

2

## Raspberry Pi + OpenNebula

# Raspberry Pi + OpenNebula: It's a match!

Raspberry Pi meets OpenNebula

## Hardware

Device: Raspberry Pi 5 (BCM2712)

RAM: 4GB / 8GB Recommended

Storage: NVMe SSD (PCIe) preferred

Network: Gigabit Ethernet / PoE+

Cost: 50€ - 100€ (8GB)

## Software Stack

OS: Ubuntu Server 24.04 LTS

Hypervisor: KVM with ARM

Platform: OpenNebula 7.0 "Phoenix"

Web UI: FireEdge Sunstone

Marketplace: Pre-built ARM64 Appliances

## Two deployment paths:

**MiniONE** — Quick single-command setup for testing & development

**OneDeploy** — Ansible-based IaC for production deployments

# Option 1: MiniONE

From zero to cloud in less than **2 minutes**

**MiniONE** is a **single-script installer** designed to deploy a full **OpenNebula stack** on a single machine. Optimized for Edge nodes, labs, and PoC environments.

1

## Flash Ubuntu

Flash Ubuntu Server 24.04 LTS (**ARM64**) to your microSD or SSD.

2

## Update System

Ensure the **local package** is updated.

3

## Execute the MiniONE script

Download and run the MiniONE script with default or custom parameters.

BASH — DEPLOY-CLOUD.SH

```
$ sudo apt update && sudo apt upgrade -y

$ wget \

  'https://github.com/OpenNebula/minione/

  releases/latest/download/minione'

$ chmod +x minione

$ sudo ./minione

# Initializing OpenNebula "Phoenix" 7.0 ...
```

**After ~90 seconds: Full OpenNebula cloud with Sunstone UI, Alpine VM template, and KVM hypervisor!**

# Option 2: OneDeploy

Infrastructure as Code for production edge deployments

OneDeploy is a **set of Ansible playbooks** for automated, repeatable deployments. Ideal for multi-node clusters and production environments.

## When to Use OneDeploy

- ✓ Multi-node ARM64 edge clusters
- ✓ Production-ready deployments
- ✓ Repeatable infrastructure setup
- ✓ Custom network/storage configs
- ✓ High-availability requirements

## What It Configures

- ⚙️ Control plane + orchestration APIs
- ⚙️ Web UI with HTTPS (Sunstone)
- ⚙️ KVM hypervisor nodes
- ⚙️ Virtual Network: Bridge, VXLAN, EVPN
- ⚙️ Storage: Local, Shared, Ceph

BASH — ONE-DEPLOY

```
$ git clone https://github.com/OpenNebula/one-deploy && cd one-deploy
$ make requirements && hatch shell
$ ansible-playbook -i inventory.yml opennebula.deploy.main
```

# But how can **you** create a custom appliance?

## CLI-Based Wizard

A streamlined, **interactive command-line** interface that guides you **step by step** in the process..

## Docker Integration

Easily convert **Docker-based images** into **production-ready KVM Virtual Machines** with persistent storage.

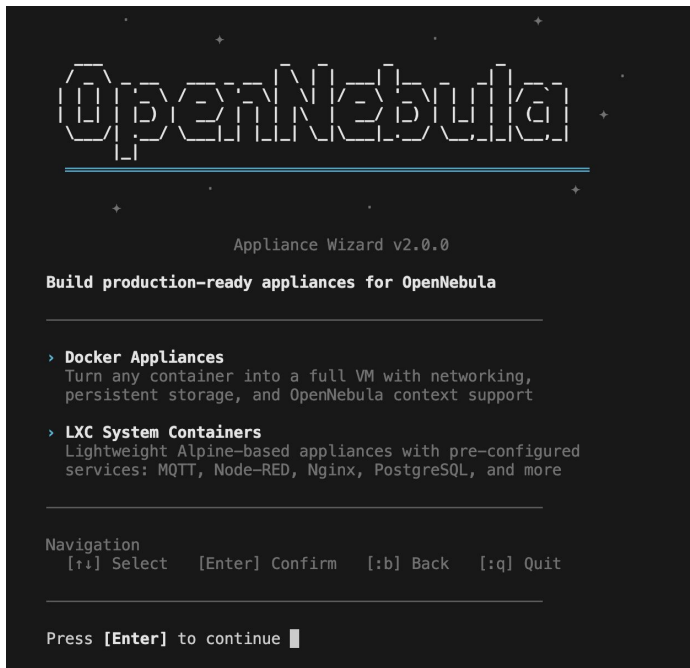

## LXC System Containers

Deploy lightweight **LXC Alpine-based appliances** with pre-configured services like **MQTT**, **Node-RED**, and **PostgreSQL**.

## Multi-Arch Support

**Full compatibility** across both **x86** and **ARM** architectures for versatile edge deployment.

3

## Live Demo 🎬: Wizard & UI

4

## Real-World Use Cases

## Homelab & Hosting

- Personal **private cloud** environment
- Self-hosted services (Nextcloud, GitLab)
- Home automation hub

## IoT & Edge Computing

- **Real-time** sensor data processing
- Distributed edge nodes
- Industrial automation

## Education & Research

- **Edge computing labs**
- Affordable virtual lab environments
- Academic research testbeds

# Far-Edge & IoT: The O-CEI Model

O-CEI is an EU-funded Horizon Europe project to orchestrate the **Cloud-Edge-IoT continuum**. It uses a **Blueprint-Driven Methodology** to translate high-level requirements into repeatable **technical deployments** across **8 different pilots**, such as electricity grids, agrifood or logistics, with **high technical maturity (TRL 7)**.

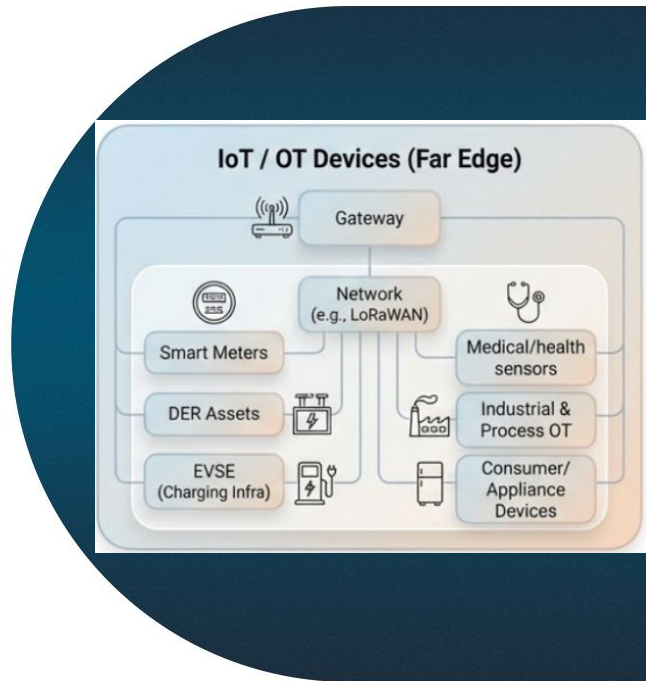

- **Practical Extension**

In O-CEI, we have successfully extended the framework by adding a **Far-Edge / IoT** layer specifically to manage small, low-power devices and sensors at the industrial ground level.

- **Our Proposal for IPCEI v3.0**

We propose exploring the addition of this same layer to the **next ICRA version** to finally **connect** everything from the **Data Center** down to the **individual IoT device or sensor**.

5

## Key Takeaways

- ✓ **Edge computing is accessible:** Enterprise cloud is now affordable; a Raspberry Pi can run full orchestration software.
- ✓ **Native ARM64:** OpenNebula 7.0 removes the "heavy platform" barrier for edge computing.
- ✓ **Flexible Implementation:** Use *MiniONE* for rapid PoCs or *OneDeploy* for production clusters.
- ✓ **Unified Experience:** Maintain the same *Sunstone UI* and features from data center to edge.
